**San Diego, CA**

**January 21, 1998**

## Netstation

**Netstation** is a system composed of **network-attached peripherals (NAPs)** created by replacing the system bus in a workstation with a gigabit network.

- Use Internet protocols for ubiquitous device access
- Based on ATOMIC 640 Mbps switched network

## The Netstation Project

Gregory Finn (project leader),  
Steve Hotz,  
Rodney Van Meter,  
Bruce Parham and Reza Rejaie

<http://www.isi.edu/netstation/>

Technologies for NAPs:

- Networking protocols
- OS paradigms
- NAP security
- Multimedia & storage

## Talk Outline

- Introduction
- Network Technologies
- NAPs in Mass Storage
- Operating System Support
- Conclusion

## What is a Network Attached Peripheral?

Any computer peripheral attached directly to some form of network, rather than a bus.

- ATM frame buffers
- Fibre Channel disk drives
- 1394 cameras
- SSA RAID arrays
- HiPPI tape drives

## Characteristics of Network-Attached Peripherals (NAPs)

- Scalable physical interconnect  
(# of nodes, distance, etc.)
- No physically defined **owner**
- Interconnect shared w/ general-purpose traffic  
==> imperfect control over net use
- Higher latency than bus
- Delivery subject to usual network problems  
(packet loss, out-of-order delivery, fragmentation, etc.)
- Support for **3rd party transfer**  
(direct device-to-device communication)

Present in varying degrees in different systems.

## Problems Faced with NAPs

Closed, bus-centric architecture allows simplifying assumptions about resource identification, security and sharing.

- Set of resources not constrained by architecture
- Network issues of scale & heterogeneity
- Control of devices not limited to bus master
- Non-dedicated network
- Security now paramount

## What are NAPs Good for?

- Better scaling (distance, # nodes, aggregate bandwidth)
- Simpler cabling
- Direct device-to-device communication
- Direct device-to-client comm. reduces server load
- Better sharing

## Talk Outline

- Introduction
- **Network Technologies**
- NAPs in Mass Storage
- Operating System Support
- Conclusion

## Network Technologies for NAPs

All seven layers in ISO model open to debate

- Application
- Presentation
- Session
- Transport
- Network
- Link
- Physical

## Proposed & In-Use Networks

- HiPPI 800
- HiPPI 6400
- Fibre Channel fabrics
- Fibre Channel Arbitrated Loop
- FireWire (1394)
- Gigabit ethernet
- ATM
- Serial Storage Architecture (SSA)
- Myrinet
- SBCON
- various others

## Networking Problems for NAPs

as I/O Nets Get Larger and More Complex:

- Media Bridging  
(Routing, Addressing)
- Congestion
- Flow Control
- Demultiplexing @ Endpoints  
(Destination Address Calculation, Control/Data Sifting, Upper Layer Protocols)
- Latency Variation
- Security
- Reliability
- Heterogeneity  
(Hosts, Traffic Types, Nets)

All Become Bigger Problems!  
But...

HiPPI-6400\*gigabit Ethernet\*Myrinet\*FC-AL

1394\*HiPPI-800\*ATM\*SSA\*Fibre Channel

---

## The Internet Community Has Solved Most of the Problems

- Strengths of IP: issues of scale and heterogeneity
- Weakness: Performance
- ISI's Netstation is using & promoting TCP/IP and UDP/IP
- Performance problems can be solved

## Advantages of IP

- **Heterogeneous Interconnects**
  - Intra-Machine Room
- **Wide-Area Access**
  - Enables Remote Mirroring and Backups
- **Future Growth**
  - Not Media-Specific
- **Lower R&D Investment in Networking**

## Talk Outline

- Introduction
- Network Technologies
- **NAPs in Mass Storage**
- Operating System Support
- Conclusion

## NAPs in Mass Storage

- SGI Origin 2000?
- CMU Network-Attached Secure Disk (NASD)
- HPSS
- LLNL's Network-Attached Peripheral (NAP) RAID
- Fibre Channel Disk Drives
- Palladio at HP Labs
- Petal/Frangipani at DEC
- Global File System from UMinn
- National Storage Industry Consortium's NASD Committee  
<http://www.hpl.hp.com/SSP/NASD/>

## Network Disk Services

Should a drive present a SCSI (block) model, or NFS (file) model, or something in between?

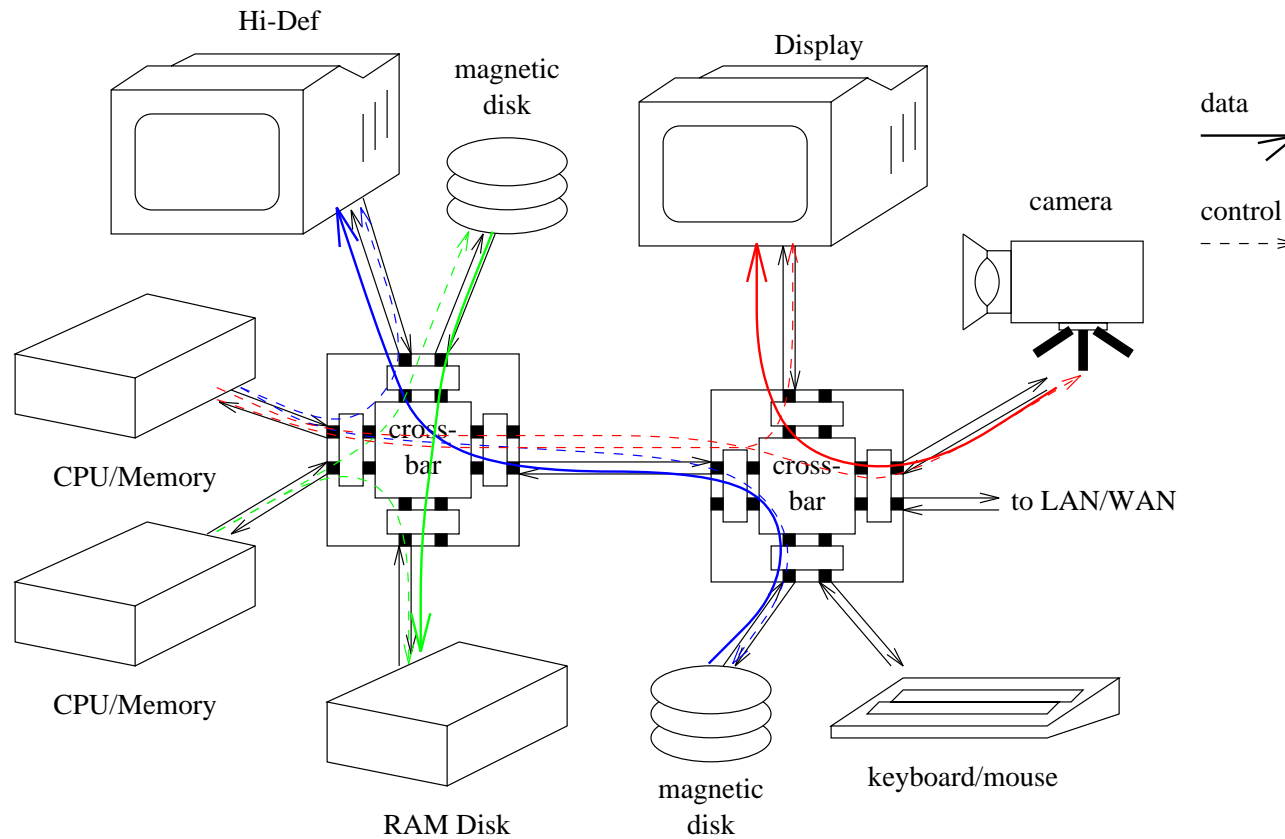

- Low-level interface easily supports other uses (non-Unix file systems, databases, swap space, network RAID)
- File model may distribute functionality more widely, scaling better
- Architectural tradeoffs are complex

# Third Party Transfer

- Direct device-to-device transfer

## Talk Outline

- Introduction
- Network Technologies
- NAPs in Multimedia
- NAPs in Mass Storage
- **Operating System Support**
- Conclusion

## Operating System Issues with NAPs

- Resource discovery
- Concurrency/sharing
- Security
- Programming paradigms for third-party transfer

## Security

- Access not physically constrained
- Cryptographic authentication required
- **Who** a request comes from is more important than **where**
- Devices don't understand "users"
- Netstation approach: Derived Virtual Devices (DVDs)

## Third-Party Transfer

- **read/write** paradigm inadequate -- generalize to **move(source, destination)**
- Concurrency management
- Error handling: to partner, requestor or owner of one or both devices?
- Details: boundary conditions, blocking factors, generalized RPC formats

## Conclusions

- Network Attached Peripherals (NAPs) allow new system architectures
  - More scalable interconnects
  - Direct device communication
- Key issues:
  - Security**
  - Scale**
  - Performance**
  - Legacy**
